

Lab 7: Create a Marketing Campaign with Multiple AI Agents

Duration: 55 minutes

Topic: 4

Objective

Coordinate research, audience, strategy, copy and review agents to produce a source-backed campaign pack that stops before publication.

Deliverable

A campaign brief, evidence map, three channel variants, claim review, experiment plan and human approval record.

Prerequisites

- A trainer-approved laptop and classroom workspace.
- Use only fictional data supplied in this lab.
- Do not paste API keys, customer data or personal information into evidence.
- Lab 5 structured handoff pattern and Lab 6 business-case model.

Procedure

Step 1: Read `product-evidence.md`, `brand-rules.md` and `audience-data.csv`. Treat all facts as fictional classroom data.

Step 2: Create a coordinator task that assigns research, audience, proposition, creative and risk-review roles.

```
hermes chat --toolsets file,web,delegation,skills
```

Step 3: Give each specialist only the files it needs and the handoff schema in `campaign-handoff.md`.

Step 4: Require the research agent to map every factual claim to a supplied source line or label it assumption.

Step 5: Require the audience agent to define inclusion and exclusion without sensitive inference.

Step 6: Require the strategy agent to propose one measurable hypothesis and the creative agent to draft email, social and landing-page variants.

Step 7: Route all variants to the risk reviewer for claim, rights, privacy and brand checks.

Step 8: Assemble campaign-pack.md only after every handoff has passed or has an explicit blocker.

Step 9: Complete approval-record.md. Do not send, publish, buy media or modify a CRM.

Step 10: Run the verifier and conduct a peer challenge of one claim and one audience assumption.

```
python3 verify.py
```

Acceptance test

The campaign pack contains three differentiated channel drafts, a traceable evidence map, an experiment hypothesis, visible unresolved assumptions and human-controlled release.

Evidence checklist

- [] Commands or configuration used (with secrets redacted)
- [] Screenshot or generated-file evidence
- [] Acceptance test result
- [] One failure and how it was resolved
- [] Reflection: one control or improvement

Safety and cleanup

- Use fictional data only.
- Never submit .env, tokens, keys or personal information.
- Stop classroom gateways and remove recurring jobs after evidence capture.
